

RATCHET TYPE SCREWDRIVER

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a screwdriver, and more particularly
5 to a ratchet type screwdriver, wherein the user can view the inside of the
screwdriver to inspect and adjust connection between the pawl members and
the ratchet wheel, thereby facilitating the user repairing the screwdriver.

2. Description of the Related Art

A conventional screwdriver in accordance with the prior art shown in
10 Fig. 19 comprises a body 90, a ratchet wheel 91 mounted on the body 90 and
having an outer wall formed with a toothed portion 910, two pawl members 92
each pivotally mounted in the body 90 and each a first face formed with a
toothed portion 920 engaged with the toothed portion 910 of the ratchet wheel
91, and two elastic members 93 each urged between a second face of a
15 respective one of the pawl members 92 and the body 90.

However, each of the pawl members 92 has a first side toothed
portion A' and a second side toothed portion B' with a greater height
differential H', so that the second side toothed portion B' of each of the pawl
members 92 has a smaller thickness. Thus, each of the pawl members 92
20 cannot withstand a larger torque to drive the ratchet wheel 91 to rotate, so that
the pawl members 92 are easily worn out at the second side toothed portion B'.

SUMMARY OF THE INVENTION

The primary objective of the present invention is to provide a screwdriver, wherein the cover can be removed from the body, so that the user can inspect and adjust connection between the pawl members and the ratchet wheel, thereby facilitating the user repairing the screwdriver.

5 Another objective of the present invention is to provide a screwdriver, wherein the catch plate stops movement of the ratchet wheel and the pawl members, thereby preventing the ratchet wheel, the pawl members and the elastic members from detaching from the body after the cover is removed from the body.

10 A further objective of the present invention is to provide a screwdriver, wherein each of the pawl members can withstand a larger torque to drive the ratchet wheel to rotate.

In accordance with the present invention, there is provided a screwdriver, comprising a body, a ratchet wheel, two pawl members, two
15 elastic members, a cover, and a catch plate, wherein:

the body has a first end formed with a receiving hole and a plurality of receiving recesses each communicating with the receiving hole, the first end of the body is formed with a positioning slit;

the ratchet wheel is mounted on the body and has an outer wall
20 formed with an annular toothed portion mounted in the receiving hole of the body;

each of the pawl members is pivotally mounted in a respective one of the receiving recesses and has a first face formed with a toothed portion engaged with the toothed portion of the ratchet wheel, each of the pawl members has an end formed with a driven block;

5 each of the elastic members is urged between a side face of a respective one of the receiving recesses of the body and a respective one of the pawl members;

the cover is rotatably mounted on the body and has a closed end formed with a depression formed with a protruding urging block having two
10 urging sides each of which is movable with the cover to press the driven block of a respective one of the pawl members; and

the catch plate is mounted in the positioning slit of the body to catch the ratchet wheel and the pawl members, thereby preventing the ratchet wheel, the pawl members and the elastic members from detaching from the body.

15 Further benefits and advantages of the present invention will become apparent after a careful reading of the detailed description with appropriate reference to the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

DETAILED DESCRIPTION OF THE INVENTION

Referring to the drawings and initially to Figs. 1-8, a screwdriver in
10 accordance with the preferred embodiment of the present invention comprises a body 10, a ratchet wheel 20, two pawl members 30, two elastic members 40, a cover 50, a catch plate 70, and a snap ring 80.

The body 10 has a first end formed with a receiving hole 11 and a plurality of (preferably two) radially and symmetrically arranged receiving
15 recesses 12 each communicating with the receiving hole 11 and a second end 15 formed with a channel 16 communicating with the receiving hole 11. Each of the receiving recesses 12 of the body 10 has two parallel sides 121. The second end 15 of the body 10 has a periphery formed with a plurality of protruding fixing blocks 151.

20 The ratchet wheel 20 is mounted on the body 10 and has an outer wall formed with an annular toothed portion 21 mounted in the receiving hole 11 of the body 10. The ratchet wheel 20 has a first end formed with a polygonal

recess 24 and a second end formed with an elongated slot 23 communicating with the polygonal recess 24.

Each of the pawl members 30 is pivotally mounted in a respective one of the receiving recesses 12 of the body 10 and has two parallel sides 32.

5 Each of the pawl members 30 has a first face formed with a toothed portion 31 engaged with the toothed portion 21 of the ratchet wheel 20 and a second face formed with a locking portion 34. Each of the pawl members 30 has an end formed with a driven block 33.

Each of the elastic members 40 is mounted on the locking portion 34
10 of a respective one of the pawl members 30 and is urged between a side face of a respective one of the receiving recesses 12 of the body 10 and a respective one of the pawl members 30.

The cover 50 is rotatably mounted on the body 10. The body 10 has a periphery formed with a radially arranged receiving bore 14 for receiving an
15 elastic member 61 and a positioning ball 60 which is urged on an inner wall of the cover 50. The inner wall of the cover 50 is formed with a plurality of (preferably three) positioning recesses 54, and the positioning ball 60 of the body 10 is detachably positioned in either one of the positioning recesses 54 of the cover 50. The cover 50 has a closed end formed with a through hole 51, and
20 the first end of the ratchet wheel 20 is extended through and protruded from the through hole 51 of the cover 50. The closed end of the cover 50 is formed with a depression 52 formed with a protruding urging block 53 having two urging

sides 531 each of which is movable with the cover 50 to press the driven block 33 of a respective one of the pawl members 30.

The first end of the body 10 is formed with a positioning slit 13 located in front of the receiving hole 11 and the receiving recesses 12. The
5 catch plate 70 is mounted in the positioning slit 13 of the body 10 to catch the ratchet wheel 20 and the pawl members 30, thereby preventing the ratchet wheel 20, the pawl members 30 and the elastic members 40 from detaching from the body 10.

The snap ring 80 is mounted on the ratchet wheel 20 and rested on the
10 cover 50 to retain the cover 50 on the body 10. Preferably, the outer wall of the ratchet wheel 20 is formed with an annular groove 22 located beside the toothed portion 21, and the snap ring 80 is secured in the annular groove 22 of the ratchet wheel 20.

In operation, referring to Figs. 6-8 with reference to Figs. 1-5, when
15 the cover 50 is rotated on the body 10 to a position as shown in Fig. 6 where the positioning ball 60 of the body 10 is positioned in a middle one of the positioning recesses 54 of the cover 50, each of the urging sides 531 of the urging block 53 of the cover 50 is detached from the driven block 33 of a respective one of the pawl members 30 as shown in Fig. 8, so that the toothed
20 portion 31 of each of the pawl members 30 is engaged with the toothed portion 21 of the ratchet wheel 20 as shown in Fig. 7.

In such a manner, when the body 10 is rotated clockwise or counterclockwise, both of the pawl members 30 are driven by the body 10 to drive the ratchet wheel 20 to rotate clockwise or counterclockwise, so that the screwdriver functions as a common dual-directional screwdriver.

5 Alternatively, referring to Figs. 9-11 with reference to Figs. 1-5, when the cover 50 is rotated on the body 10 to a position as shown in Fig. 9 where the positioning ball 60 of the body 10 is positioned in a rightward one of the positioning recesses 54 of the cover 50, a rightward one of the urging sides 531 of the urging block 53 of the cover 50 is urged on the driven block 33 of a
10 respective one of the pawl members 30 as shown in Fig. 11, so that the toothed portion 31 of a rightward one of the pawl members 30 is detached from the toothed portion 21 of the ratchet wheel 20 as shown in Fig. 10.

In such a manner, when the body 10 is rotated clockwise, a leftward one of the pawl members 30 is driven by the body 10 to drive the ratchet wheel
15 20 to rotate clockwise, and when the body 10 is rotated counterclockwise, the rightward one of the pawl members 30 slips from the ratchet wheel 20, so that the body 10 idles in the counterclockwise direction. Thus, the screwdriver functions as a ratchet type one-way screwdriver.

Accordingly, the cover 50 can be removed from the body 10 as
20 shown in Fig. 1, so that the user can inspect and adjust connection between the pawl members 30 and the ratchet wheel 20, thereby facilitating the user repairing the screwdriver. In addition, the catch plate 70 stops movement of the

ratchet wheel 20 and the pawl members 30, thereby preventing the ratchet wheel 20, the pawl members 30 and the elastic members 40 from detaching from the body 10 after the cover 50 is removed from the body 10.

Referring to Fig. 12, the receiving recesses 12 of the body 10 are
5 radially arranged with an included angle of 120 degrees and have central lines intersecting at a point which is distant from the center of the receiving hole 11 of the body 10 by 2.2mm. Each of the pawl members 30 has a first side toothed portion A and a second side toothed portion B with a height differential H which is smaller than the height differential H' as shown in Fig. 19, so that the
10 second side toothed portion B of each of the pawl members 30 has a greater thickness. Thus, each of the pawl members 30 can withstand a larger torque to drive the ratchet wheel 20 to rotate.

Referring to Figs. 13 and 14, the receiving bore 14 is formed in the first end of the body 10 and located beside the receiving hole 11 of the body 10,
15 and the positioning recesses 54 are formed in the closed end of the cover 50. In addition, the positioning slit 13 of the body 10 has an opened shape, the catch plate 70 is formed with a through hole 701, and the screwdriver further comprises a screw member 71 extended through the through hole 701 of the catch plate 70 and screwed into the positioning slit 13 of the body 10.

20 Referring to Figs. 15 and 16, the depression 52 and the urging block 53 of the cover 50 are located at different positions, and the receiving recesses

12 and the positioning slit 13 of the body 10 are located at different positions correspondingly.

Referring to Figs. 17 and 18, the screwdriver comprises four pawl members 30 and four elastic members 40, and the body 10 has four radially and
5 symmetrically arranged receiving recesses 12.

Although the invention has been explained in relation to its preferred embodiment(s) as mentioned above, it is to be understood that many other possible modifications and variations can be made without departing from the scope of the present invention. It is, therefore, contemplated that the appended
10 claim or claims will cover such modifications and variations that fall within the true scope of the invention.
